

BookVerse

Functional Requirements Document (FRD)

Introduction

This document presents the functional requirements of the BookVerse platform. The purpose of this document is to describe the main system functionalities from the user's perspective. The document focuses on two core functions: user authentication and review management.

Function 1: User Login

The User Login function allows registered users to securely access their accounts using their email address and password. After successful authentication, the system grants the user access to protected features within the platform.

Attribute	Details
Actor	Registered User
Route	POST /auth/login
Inputs	Email address and password
Precondition	The user must already have an account in the system.
Process	The system validates the entered credentials and checks them against the database.
Output	Successful login and authentication tokens, or an error message if authentication fails.
Error Handling	The system displays appropriate messages for invalid credentials or empty fields.

Function 2: Create or Update Review

This function enables authenticated users to create a new review for a book or update an existing review. Users can submit their opinions and feedback through a review text field associated with a specific book.

	Details
Actor	Authenticated User
Route	PUT /books/:id/reviews

Inputs	Book ID and review text
Precondition	The user must be logged in and the selected book must exist.
Process	The system checks whether the user already submitted a review for the selected book. If a review exists, it is updated; otherwise, a new review is created.
Output	Review successfully created or updated, or an error message if validation fails.
Error Handling	The system displays validation messages when review text is missing or the book does not exist.
